

# DataSense

The world's first and only content-aware data security and management system. In today's IT environment, data is everywhere, yet over 62% of companies have no idea where their most critical data assets reside.

DataSense's agent-less and content-aware approach results in radically faster, more accurate, scalable, and more adaptive data security than do traditional solutions. Using Cognitive Computing, DataSense can classify data, enforce data policies, and actively mitigate data at risk in real time.

Human-Free. Agent Less. Comprehensive

# Why DataSense?

## Centralized index

DataSense uses Cognitive Computing to extract and index context and insights out of structured and unstructured data.

## Search Engine

The powerful, centralized index and a native search engine provide answers to security- and business-related questions.

## Human Free

DataSense's automation saves time and effort. AI-powered data categorization, keyword and entity extraction, and predefined policies delivering ROI from day one.

## Policy and Alerts

The out-of-the-box best-practices Policy Center enables the identification of potential risks and alerts to the SOC team in real time.

## Data Fusion

DataSense creates new insights by fusing different data sources, for example, locating CRM entities in SharePoint documents.

## Documents and Databases

Most common file types (PDFs, Microsoft Office documents, etc.) are supported, as are CAD and scanned documents, as well as common relationalDBs (MSSQL, Oracle, MySQL, etc.). NoSQL databases, such as Hadoop and MongoDB, will be supported soon.

## Cloud Services

DataSense supports most common cloud services, including AWS-S3, Office 365, Box, Google Drive, OneDrive, and more.

## Data Clustering

DataSense suggests new data categories based on AI-Powered document similarity metrics.

## Agent-Less

Our solution is deployed on a centralized virtual appliance. It uses common data management protocols to monitor and enforce.

## Third Party Integrations

The platform is designed to integrate with many of the technologies you're using today, such as SIEM, DLP, classification tools such as AIP, Boldon James, and more, thereby improving your existing data protection tools.

## Compliance Reports

DataSense's reports help demonstrate compliance with different regulations, such as GDPR, NIST, and ISO 27001.

## Built to Scale

DataSense's elastic nodes can effectively scale to monitor and manage petabytes of data.
